

Joshua Sam Varughese . Jarvis Consulting

Computer Science graduate with hands-on experience in backend development, automation, and data processing. Skilled in Python, SQL, and Linux, with practical knowledge of Jenkins, Docker, and AWS from both academic and industry projects. Developed backend systems using Flask and AWS services, built monitoring tools in Linux using Bash and PostgreSQL, and contributed to automation pipelines during an internship at Ford Motors. Focused on building efficient, reliable, and well-structured backend solutions that support data-driven operations.

Skills

Proficient: Python, Linux/Bash, RDBMS/SQL, Agile/Scrum, Git, Jenkins

Competent: Flask, Docker, Proxmox VE, Networking, AWS Cloud Services

Familiar: Java, C++, Haskell, React, Django, HTML/CSS, JavaScript

Jarvis Projects

Project source code: https://github.com/jarviscanada/jarvis_data_eng_JoshuaVarughese

Cluster Monitor [GitHub]: Developed a Linux-based monitoring agent using Bash to collect CPU, memory, and disk usage data from multiple nodes. Designed and deployed a Dockerized PostgreSQL database to store collected metrics and wrote SQL queries to validate and analyze resource usage. Automated data collection through cron jobs and verified reliability through manual testing. This project strengthened understanding of Linux administration, shell scripting, and containerized data management.

Highlighted Projects

All At Mac: Built the backend for a campus events and marketplace application using Python's Flask framework and AWS Cloud Services. Integrated AWS Cognito for secure user authentication, DynamoDB for structured data storage, and S3 for media management. Designed RESTful APIs for posting, searching, and retrieving content, and wrote unit tests using PyTest to ensure backend reliability. Presented the working prototype at McMaster's Capstone Expo.

Professional Experiences

Software Test Automation Intern, Ford Motor Company (2022-2023): Worked on the QA and automation team to maintain and improve CI/CD pipelines. Used Python and shell scripting to troubleshoot automation failures and updated Jenkins DSL configurations to restore broken test nodes. Produced detailed weekly reports summarizing test outcomes and recurring issues. Collaborated with developers and QA engineers in Agile sprints using Jira to ensure consistent test coverage and efficient release cycles.

Software Developer, Jarvis (2025-present): Developed backend and data-engineering projects with a focus on automation, monitoring, and data processing. Worked extensively with Python, Bash, SQL, and Docker in a Linux environment to build and test backend components. Collaborated on designing reliable data pipelines and automation scripts to support performance monitoring and reporting.

Education

McMaster University (2019-2024), Bachelor of Applied Sciences, Computer Science

Miscellaneous

- Guitarist and music enthusiast
- Interested in videography and photography
- Contributed to branding and outreach for a healthcare-focused small business
